

REDISCOVERING NEW FEATURES OF CHINESE QI THEORY FROM THE MEDIATING ROLE OF QI AND INFORMATION

Yaru Chen

Abstract: *The sympathetic mediation of Qi theory and the intelligent mediation of information can be implemented in all aspects of thinking phenomena. Comparing the mediation of Qi and information at different levels is conducive to discovering the general process and mechanism of cognition. The most fundamental reason for the singleness and one-sidedness of thinking is that there is no more reasonable philosophical paradigm to support it. With the help of the paradigm revolution of information philosophy, we can re-understand the Chinese Qi theory, and its more compatible scientific research methods can further explore the new characteristics of Chinese Qi theory. Comparing the types and levels of Qi theory sympathetic mediation with the types and levels of information intelligent mediation is also a good entry point for rethinking the research methods of Chinese Qi theory science.*

Keywords: *Qi, information intermediary, material, spirit*

Introduction

The theory of Qi represents the Chinese philosophy's search for the origin of the world from the form of material unity, which is also the characteristic that distinguishes it from the material view of Western philosophy. Through the combing and comparison of the history of philosophy, it can be found that at every stage of the development of the material view of Western philosophy, scholars have compared the material view of Chinese Qi theory with it. Around the different understandings of "Qi", various natural philosophical theories in ancient China were formed, involving various disciplines such as knowledge,

practicality, and artistry. The academic community generally compares the Chinese theory of Qi with several typical forms of the development of the material view of Western philosophy, such as the material view of early Greek natural philosophy, atomism, and energeticism. The reason why the theory of Qi can be constantly compared with the material view of Western philosophy as it develops is that the theory of Qi itself is vast and complex, and the excavation of the characteristics of the theory of Qi itself is also a process. The latest modern scientific theories not only have something in common with the ancient Chinese theory of Qi, but also the potential scientific ideas of the theory of Qi will inspire modern scientific theories. There are indeed differences and similarities between the material views of Chinese and Western philosophy, which are worth exploring, but it should be noted that the way of understanding Chinese Qi theory is essentially different from the way of understanding the dichotomy of matter and spirit in traditional Western philosophy. The easiest way to prepare your manuscript in accordance of these rules is simply to replace the content of this sample sheet with your own material.

Comparison of the mediating role of Qi and information at different levels

The starting point of Qi theory and information philosophy epistemology is based on the universal difference relationship between things. It is precisely because of the universal difference of things that the diversity of things can be constructed through multi-level mediation and things can be understood through multi-level mediation. Zhang Liwen pointed out that Chinese philosophical theoretical thinking is based on sympathy, which is very important because the "mediation" we emphasize is also based on sympathy. Qi theory has been circulated in China for more than two thousand years. As a whole existence of Chinese thought, its richness is worth exploring. Unfortunately, the Qi theory thought in the history of philosophy or the general history of thought mainly summarizes the evolution of Qi theory thought based on historical development, and does not pay too much attention to the research methods of Qi theory itself. To this day, it still needs to be further explored with new perspectives and methods. Comparing the mediating role of Qi and information at different levels

helps us discover the general process and mechanism of cognition, and the process and mechanism of cognition established by multi-level mediation is different from the traditional Western material and spiritual dichotomy of cognition and thinking. Analyzing the types and levels of Qi theory sympathetic mediation is also a good entry point for the overall study of Qi theory thinking. Because the sympathetic mediation of Qi theory and the intelligent mediation of information can be implemented in all aspects of thinking phenomena, just like the knots on the network of overall system cognition.

The mediation of Qi and information shows the relationship network between the categories and forms of things, which is a nonlinear organic whole system that is linked and unfolded in a chain. The relationship between them cannot be studied by a single method. In the intelligent era of the information revolution, we are facing more in-depth learning and cross-border communication, which has an unprecedented impact on our way of thinking. This requires a deeper understanding of sympathetic connection and intelligent conversion. The sympathetic mediation of Qi theory is the joint point of Chinese philosophical thinking. The sympathetic mediation is like a knot on the network of overall system cognition, which can be implemented in all aspects of thinking phenomena. In the intelligent era of the information revolution, the understanding of the sympathetic mediation of Qi theory can introduce a new perspective. Introducing the perspective of information philosophy, Qi and information are compared, and it is found that Qi and information have more general and universal characteristics in the mediation of the interaction between matter and matter. The dual existence of Qi and information can be connected between matter and spirit, and the mediating role played by Qi and information in the process of interaction between matter and spirit is compared and discussed. The problems with previous research methods on Chinese Qi theory point out that the most fundamental reason for the single-mindedness and one-sidedness of thinking is the lack of a more reasonable philosophical paradigm to support it. Using such thinking to analyze the problems of Chinese Qi theory is also one-sided and divisive.

Rediscover the new characteristics of Chinese Qi theory with the help of the cognitive methods of information philosophy

The ideological system of information philosophy is based on the fundamental change of philosophy by the information paradigm, which is mainly reflected in the redivision of the field of existence, which fundamentally changes the connotation of existence. The discovery of the concept of "objective non-reality" and the introduction of this concept into the philosophical system reflect the revolution of the information philosophy paradigm. The paradigm revolution of information philosophy has brought new inspiration to the methods of studying ancient Chinese Qi theory. Different descriptions of the world picture contain different ways of thinking. The change of scientific paradigm provides a new method for re-understanding the scientific nature of Chinese Qi theory. To explore and explain the vitality of Chinese Qi theory, to achieve philosophical and scientific breakthroughs in the study of Qi theory and to promote the new development of Chinese philosophy in the field of world philosophy, it is necessary not only to compare the perspective of philosophy but also to explore scientific research methods. By fully studying the characteristics and relationship between the sympathetic mediation of Qi and the intelligent mediation of information, we can also find the similarities between the multi-level mediation of Qi and information, which will help us further explore the potential scientific nature of Chinese Qi theory and promote the modern transformation of traditional Chinese philosophy. Therefore, this paper intends to rethink the research methods of Chinese Qi theory through the mediating role of Qi and information, and explore the development trend of Qi theory in modern times.

Changes in thinking will also cause changes in the cosmic picture. A truly complete cosmic picture should be a unity of matter and spirit. The establishment of information philosophy has a revolutionary significance for the all-round and fundamental transformation of traditional philosophy. Re-examining Chinese philosophy with the perspective of information philosophy has very important value and significance for deepening the understanding of ancient Chinese philosophical thoughts, exploring the value of Chinese philosophy in the current era, and enriching the research of information

philosophy. The ideological system of information philosophy is based on the discovery of the concept of "objective non-reality". The introduction of this concept into the philosophical system reflects the revolution of the information philosophical paradigm. The change of scientific paradigm provides new ideas for re-understanding Chinese Qi theory.

The discovery of the concept of "objective non-reality" and the introduction of this concept into the philosophical system break the separation between "reality" and "unreality", direct existence and indirect existence. We find that both "Qi" and information can cross the gap between objective reality and objective unreality and reach our understanding of the world. In this way, it makes sense to re-examine the scientific nature of Qi theory philosophy with information thinking. The mediating role played by information and qi in connecting the interaction and mutual transformation between things is also very similar. The ability to cross the gap between objective reality and objective unreality through information as a medium is very similar to the ability to connect the transformation between tangible and intangible things through "qi" as a medium. Therefore, changes in the world picture are always accompanied by changes in scientific thinking, and new views on matter are always accompanied by the emergence of new ways of thinking. Information thinking that accompanies information philosophy provides a new way of research thinking for re-understanding the scientific nature of Qi philosophy.

Conclusion

The Chinese people's research on Qi has lasted for two thousand years and has not declined to this day. The Chinese Qi theory mainly reflects a holistic and comprehensive way of thinking, so the study of Qi theory should pay attention to the innovation of methods. Looking back at the previous research on Chinese Qi theory, most of them were completed under the guidance of Western thinking theories and methods. Using Western thinking methods and norms to study Qi theory is suspected of cutting the original seamless Chinese Qi theory with an external existing philosophical framework. The division method of information philosophy in the field of existence is "existence = matter

+ information". The world as a whole is a dual existence of matter and information, and it reinterprets spiritual activities in the sense of the advanced form of information activities. Matter and consciousness are connected through the intermediary of self-independent information, and are no longer the two poles of the binary opposition in traditional philosophy. The paradigm revolution of information philosophy breaks through the dichotomy of the traditional thinking paradigm and embodies a holistic way of thinking. Information philosophy regards the world as an organic whole. Through the analysis of the role of mediation, we find that the world is a hierarchical, multi-level, dynamic and complex process. This requires us to start from the wholeness and integrate various methods so that we can fully understand the world.
